

CSR

Modern Lasers like the CO₂-Laser allow even a nearly painless, precise and sparing face rejuvenation.

This "Laser-Skin-Resurfacing" is suited to smooth crinkles as well as dealing with big-pored skin, acne cicatrices and similar skin patterns.

In split seconds the laser vaporized the upper skin layer. On this new smooth layer a new regenerated face skin grows without cicatrices.

The renewed skin seems to be up to 10 years younger and ages at normal speed.

Adverse reactions to be mentioned are secretions (exsudations), cauterisation and itching.

This operation is performed most of the time in general anaesthesia after having consulted the patient together with an anesthesist.

Afterwards I offer to my patients to spend the first few days here where a curator will take care of them. There are other possibilities for those who cannot afford this two-week-lasting social time-out.
