

## Computer controlled reflecting-light microscopy

I offer to my customers computer aided diagnostic of alterant birthmarks - dysplastic Naevi. Thus the melanoma - a very malignant skin cancer, also known as "black skin cancer" - can be detected and medicated.

The computer microscope not only sees in-the-breadth but also in-the-depth. The depth-expansion is a very important criteria for the degree of malignance.

### ***Indications of alterations are:***

- malignant growth
- bleeding
- pains
- marginal alterations
- color alterations
- detaching scurf

With the aid of the computer I can archive the image and compare it (ideally after one year).
